Department: **BCA - AI & DS [K.R Mangalam University]**

Industry Mentor: **Mr. Gaurav**

Project Overview

- C&O Group is a **multi-division smart event management platform** designed to digitalize event planning and client booking processes.

- The system combines two specialized divisions under one brand:
  - **Thread & Knot** – Wedding & Social Events
  - **Prism Planner** – Corporate & MICE Events

- The platform allows clients to explore services, compare packages, view portfolios, and submit online bookings.

- An integrated admin dashboard enables event managers to handle bookings, vendors, packages, invoices, and event workflows efficiently.

- The solution aims to replace manual communication and scattered management with a **centralized, technology-driven system**.

Problem Statement

- Traditional event management companies rely heavily on **manual coordination**, phone calls, and scattered communication channels.
- Clients face difficulty in comparing packages, tracking booking status, and viewing authentic portfolios before making decisions.
- Event managers struggle with handling bookings, vendors, invoices, and client communication through unorganized workflows.
- Lack of a centralized system leads to delays, miscommunication, and reduced operational efficiency.
- There is a clear need for a **digital, unified platform** that manages both client-facing services and internal operations under one ecosystem.

Motivation & Gap Evaluation

Motivation

- Increasing demand for professional and digitally managed events in corporate and government sectors.
- Clients expect transparent pricing, quick responses, and easy booking experiences.
- Event companies need automation to reduce manual workload and improve coordination.
- Growth of tech-driven event solutions creates opportunities for scalable digital platforms.

Gap Analysis

- Existing event websites mainly focus on showcasing services, not end-to-end management.
- Lack of integrated systems combining **client booking + admin workflow + vendor coordination**.
- Limited support for multi-division event companies (social + corporate events together).
- Manual invoice handling and event tracking reduce operational efficiency.

Project Objectives

- To develop a unified web platform for managing multiple event divisions under a single system.
- To enable clients to browse event categories, view portfolios, compare packages, and submit inquiries online.
- To provide an admin dashboard for managing bookings, packages, and client data efficiently.
- To automate processes such as invoice generation, event tracking, and QR-based event passes.
- To improve coordination between clients, managers, and vendors through a centralized workflow.
- To build a scalable MVP suitable for startup-based expansion and real-world deployment.

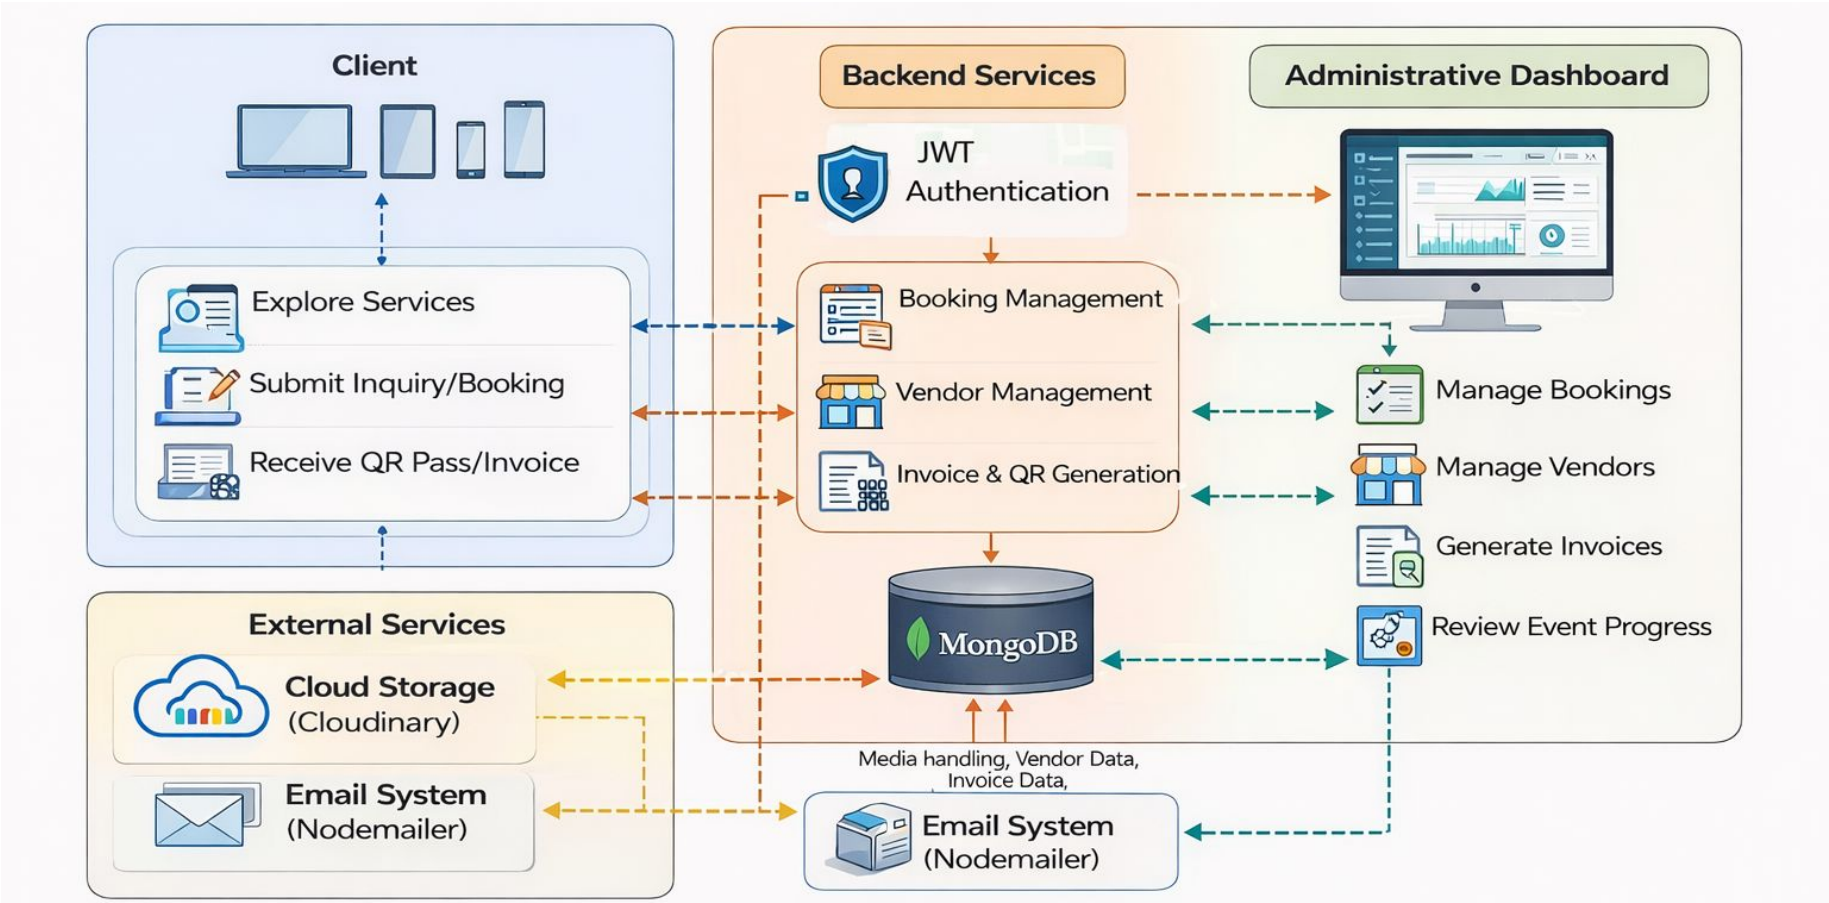
Proposed Solution

- Develop a **full-stack event management platform** for C&O Group LLP integrating multiple event divisions.
- Provide a client-facing portal where users can explore services, compare packages, and book events online.
- Implement a centralized admin dashboard for managing bookings, vendors, portfolios, and event operations.
- Automate key workflows such as booking approvals, status tracking, invoice generation, and QR event passes.
- Use a modern tech stack (Node.js, MongoDB, JWT, Cloudinary) to ensure scalability and efficiency.
- Build the solution as a **startup-ready MVP** focused on real-world usability and future scalability.

System Architecture

- Client users access the platform through a web interface to browse services and submit bookings.
- Frontend communicates with backend APIs for data handling and system operations.
- Backend server manages authentication, business logic, booking workflows, and admin operations.
- MongoDB stores user data, event packages, bookings, vendors, invoices, and portfolio details.
- Cloudinary is used for secure image storage and portfolio uploads.
- Additional modules include QR code generation and PDF invoice generation for event management automation.

Architecture Diagram



Architectural Diagram of the Proposed Event Management Platform

Key Features

Client Features

- Browse events by division (Wedding/Social & Corporate/MICE)
- View event packages, themes, and portfolio gallery
- Submit inquiries and booking requests online
- Receive booking confirmations and status updates
- Access QR-based event passes

Admin Features

- Secure admin login and dashboard
- Manage packages, bookings, and client data
- Vendor assignment and portfolio management
- Generate invoices (PDF) and QR event passes
- Track event progress and operational metrics

Features Completed

Client Module

- Homepage with C&O Group branding and division selection
- Event packages listing with category separation
- Portfolio / gallery section integration
- Booking / inquiry form UI implemented
- Basic client navigation flow completed

Admin Module

- Admin dashboard UI structure created
- Package management interface developed
- Booking management layout prepared

Backend Progress

- Project folder structure initialized
- API routing structure created
- MongoDB schema planning completed

Github Workflow

- The project is managed using **Git & GitHub** to ensure structured and trackable development.
- Repository organized into modular folders for frontend, backend, and project documentation.
- Regular commits are made to track UI development, backend structure, and feature implementation.
- Version control is used to maintain code history, avoid conflicts, and support team collaboration.
- Feature-wise development approach followed (UI design → backend setup → integration).
- README documentation maintained for project overview, setup instructions, and workflow clarity.

Technology Stack

Frontend

- HTML
- CSS
- JavaScript

Backend

- Node.js
- Express.js

Database

- MongoDB

Authentication & Security

- JWT (JSON Web Token)

External Services & Utilities

- Cloudinary (Image Storage)
- QR Code Generator (Event Passes)
- PDFKit (Invoice Generation)
- Razorpay API (Dummy Payment Integration)

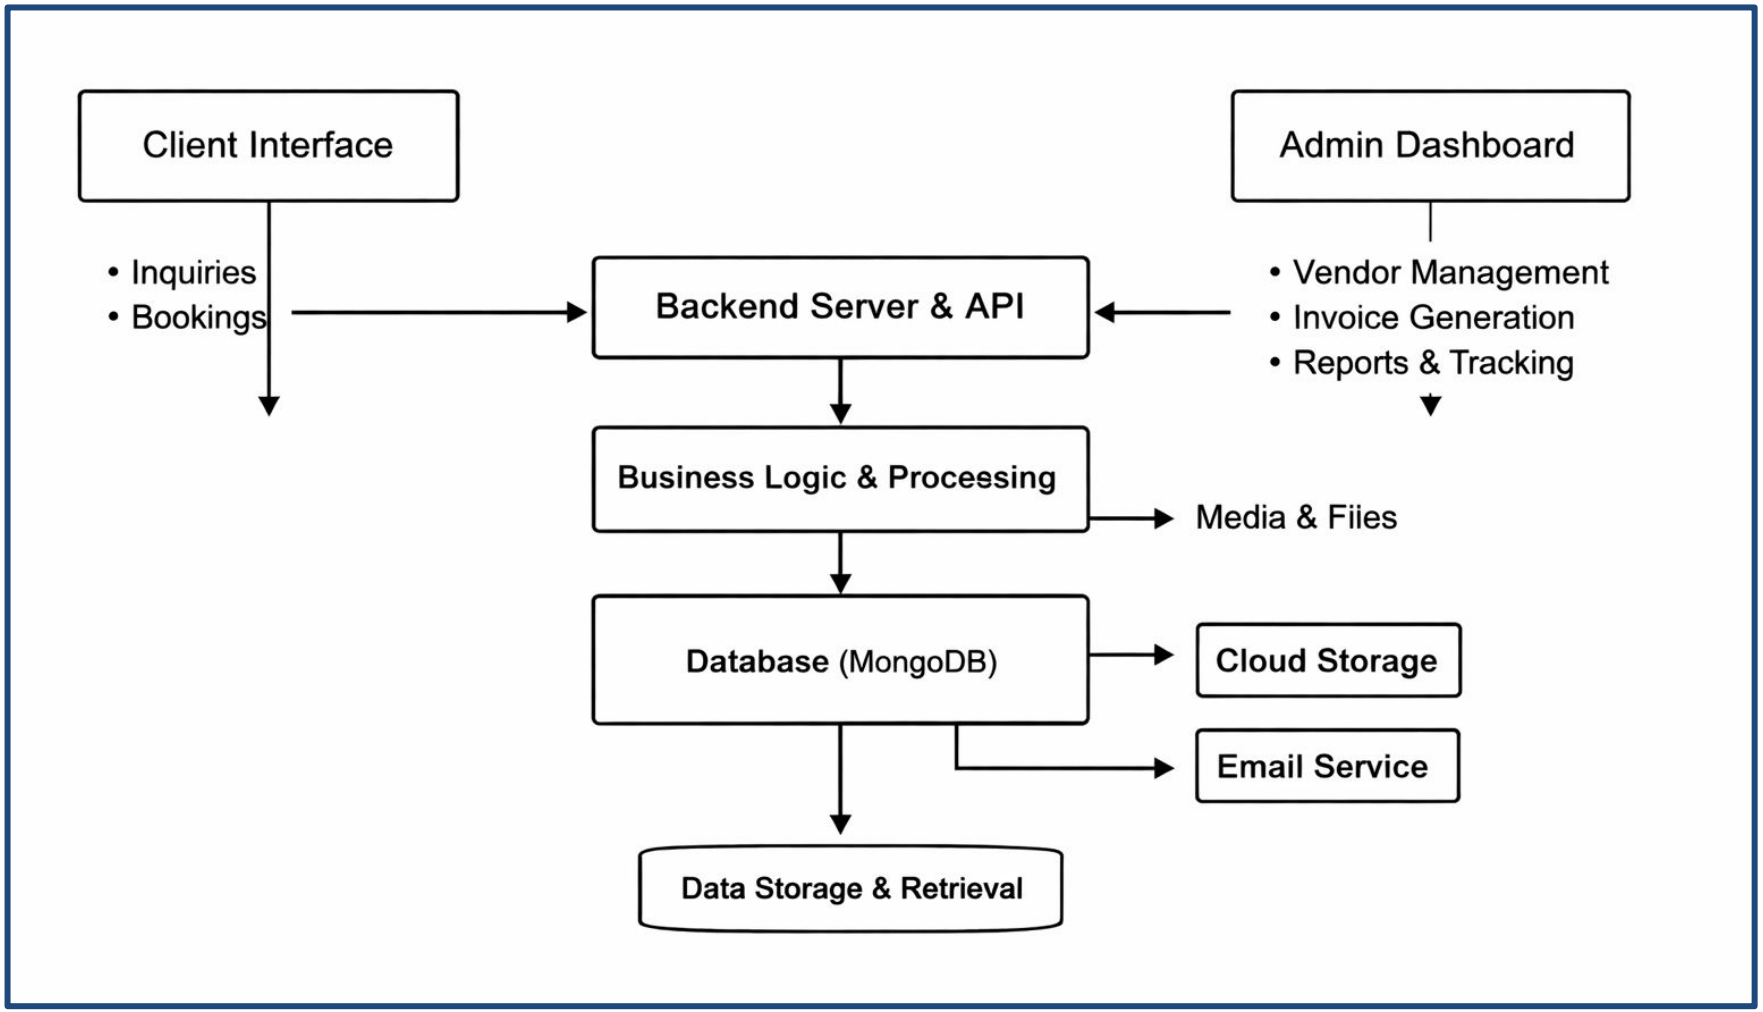
***Development* Tools**

- Git & GitHub (Version Control)
- VS Code (Development Environment)

Methodology

- Requirement analysis and scope definition based on real-world event management workflows.
- Designing system architecture separating client modules and admin operations.
- Development of frontend interfaces for booking, inquiry, and portfolio browsing.
- Backend API development for authentication, booking management, and data processing.
- Database integration for storing users, packages, vendors, and event records.
- Implementation of automation features like invoice generation and QR event passes.
- Testing and validation of core modules before deployment.

Methodology



Expected Results & Impact

Expected Results

- A functional MVP for managing multi-division event planning through a single platform.
- Streamlined client booking and inquiry process with reduced manual effort.
- Centralized admin control for packages, vendors, and bookings.
- Automated invoice generation and QR-based event access system.
- Improved data organization and operational efficiency for event management workflows.

Expected Impact

- Enhances professionalism and digital presence of event management businesses.
- Reduces communication gaps between clients, managers, and vendors.
- Supports scalable startup growth with real-world deployment potential.
- Provides a modern, technology-driven approach to event operations.

Future Work

- Complete backend API integration with frontend modules for end-to-end functionality.
- Implement full authentication and role-based authorization (Admin / Client) using JWT.
- Finalize booking approval workflow and real-time status tracking system.
- Integrate automated invoice generation and QR-based event pass modules.
- Connect payment simulation module and finalize data validation processes.
- Perform system testing, bug fixing, and performance optimization.
- Deploy the platform for live demonstration and prepare final documentation.

Project Timeline

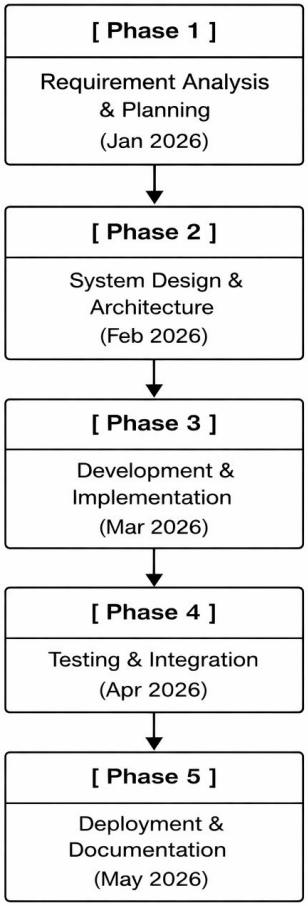


Figure: Project Timeline Flow Diagram

Conclusion & Startup Vision

- C&O Group aims to transform traditional event management into a **technology-driven, organized ecosystem**.
- The project delivers a scalable MVP that integrates client booking, admin operations, and vendor coordination in one platform.
- The solution focuses on real-world usability, automation, and operational efficiency for both social and corporate events.
- Designed with a startup mindset, the platform has strong potential for future expansion and commercialization.
- The long-term vision is to build a smart event management solution that supports data-driven planning and seamless client experiences.

THANK YOU
